USIBWC MONITORS HURRICANE ALEX IMPACT

The United States Section of the International Boundary and Water Commission (USIBWC) has sent teams out to inspect Lower Rio Grande Flood Control Project levees in Cameron, Hidalgo, and Willacy Counties, Texas to assess impacts from Hurricane Alex. The Rio Grande is not currently experiencing flood conditions. USIBWC crews are coordinating with local officials to ensure proper operation of drainage structures that pass through the Commission’s flood control levees and assisting local communities with pumps to help drain storm water.

The USIBWC on June 30 initiated 24-hour operations at its Emergency Operations Centers at its Headquarters Office in El Paso, Texas and its Lower Rio Grande Flood Control Project Office in Mercedes, Texas. The USIBWC operates a system of Rio Grande flood control levees, dams, and floodways in the region and is prepared to respond to any river flooding that could occur as the remnants of the storm continue to bring precipitation to the Rio Grande Basin. The USIBWC has deployed additional equipment and personnel from its other offices to supplement the Lower Rio Grande Flood Control Project staff. Sandbags have been filled and are ready for transport to affected areas if needed.

Should the Rio Grande experience flood conditions, USIBWC staff will move into Flood Fight Operations. During this phase of response, crews work 24 hours per day to patrol flood control levees to identify and respond to any problems that could arise such as erosion along the levees, freeboard encroachment, or seepage on the land side of the levees. Sandbagging operations will be established if needed. Crews also take more frequent flow measurements to track and document the flood. During Hurricane Dolly in 2008, flood conditions were not experienced in the USIBWC’s Lower Rio Grande
Flood Control Project although flooding occurred due to local drainage problems on the land side of the USIBWC levees.

As part of its flood operations, the USIBWC also exchanges information with the Mexican Section of the Commission regarding flood conditions. The USIBWC provides data about Mexico’s Rio Grande tributaries to the National Weather Service, which uses this and U.S. data to formulate flood forecasts. If necessary, the two Sections of the Commission jointly operate the Retamal and Anzalduas Diversion Dams according to established criteria to ensure the equitable diversion of Rio Grande floodwaters into each country’s floodway or to make flood releases from Amistad and Falcon International Storage Reservoirs located upstream on the Rio Grande. In May, the U.S. and Mexican Sections of the Commission conducted their annual flood workshop in preparation for the hurricane season.

Residents in the affected region should monitor National Weather Service warnings and forecasts for information about Tropical Storm Alex and any flood watches, warnings, and advisories that could be issued for the Rio Grande Basin.

Current information about Rio Grande flow as well as storage and release data from U.S. and Mexican reservoirs in the Rio Grande basin is available on the USIBWC web page at:
